ABSTRACT

This review focuses on 128 high schools in Georgia that have completed at least one full year under block scheduling. Information presented includes scores on the Georgia High School Graduation Tests, Scholastic Assessment Test scores, and Advanced Placement examination scores. The review is merely a summary of selected descriptive information, and the efficacy of block scheduling is not evaluated. Information is grouped according to the number of years block scheduling has been in effect: (1) one school with 5 years of experience; (2) four schools with 2 years; (3) 40 schools with 3 years; (4) 43 schools with 2 years; and (5) 40 schools with 1 year. The data are for schools with the 4x4 block schedule and those with the eight-block schedule. (Contains 128 charts.) (SLD)

Overview

The Research, Evaluation and Testing Division has compiled selected information which may suggest the impact of block scheduling among the Georgia high schools which have been granted a waiver to implement modified high school schedules. As of December 1999, 152 high schools have been granted a block-scheduling waiver. Of these schools, 128 have been implementing block scheduling for at least one full school year. The remaining 24 schools began implementing the new scheduling in August 1999. Of the 152 schools, 139 schools are implementing a 4x4 semester schedule. The remaining 13 schools are implementing a block-8 schedule. (See Appendix A for a list of the schools with block scheduling waivers, the type of scheduling implemented, and the date such scheduling went into effect.)

In a 4x4 block schedule, a course that normally covers the entire school year is compressed into an intense half-year course. Students take four courses the first semester of school and take another four courses the second semester. Students attend four 90-minute block classes per day. The block-8 schedule consists of eight courses. On alternating days, the students take four 90-minutes classes. One four period set of classes is scheduled every Monday and Wednesday. The other four period set of classes is scheduled every Tuesday and Thursday. Friday classes rotate between the Monday schedule and the Tuesday schedule.

This review focuses on the 128 schools that have completed at least one full year under block scheduling. Information presented in this review includes Georgia High School Graduation Tests (GHSGT) scores, Scholastic Assessment Test (SAT) scores, and Advanced Placement exams (AP) scores.

It is important to note that the following review is merely a summary of selected information. It is NOT the intention of this paper to evaluate the efficacy of block scheduling. This data may be considered descriptive only.

To better understand the data presented in this review, please take notice of the following information:

- The GHSGT scores presented in the tables reflect the percent of regular program students passing each section of the test the first time. Please note that 1995-96 was the first year for the Social Studies test and the first Science test was in the 1996-97 school year.
- The SAT scores presented in this review are based on the students' highest verbal and highest math scores. All the scores are recentered scores.
- AP exams are graded on a 1-5 scale; a score of 3 and above is passing. The data presented here include the number of students taking the exams, the number of tests given, the number of passing scores, and the percent passing. The number of students taking the test and the number of tests taken are different because a student may be in multiple AP courses and thus take more than one test.

- Instead of limiting the information to only one year before block scheduling for the schools, this review includes data for all the years available for the schools under review. Therefore, for schools that have a shorter history of block scheduling, more years of baseline data are presented.
- In all the tables presented in this review, the shaded rows represent the years since the implementation of block scheduling. The rows above that are for the years before block scheduling.

Review of Information from One Georgia School with Five Years of Block Scheduling School Began Block Scheduling in the 1994-95 School Year

In August 1994, Jasper County High School began block-8 scheduling. It is the only school in the state that has been implementing block scheduling for five years.

Georgia High School Graduation Tests

GHSGT information is shown in Table 1 for one year before and five years after Jasper County implemented block scheduling. In the following table, and in all the subsequent tables, "test year" 1994 represents 1993-94 school year, "test year" 1995 represents 1994-1995 school year, "test year" 1996 indicates 1995-1996 school year, and so on. By looking at the scores for Jasper County High School over the last six years, even though the scores are not always a steady improvement year by year, all scores for the block scheduling years are higher than the one year before block scheduling.

Table 1
High School Graduation Tests

School Name	Test Year	Math % Pass	Lang.Arts % Pass	Writing % Pass	Science % Pass	SocSci % Pass
Jasper County	High					
	1994	76	84	83		
	1995	81	91	96	•	
	1996	88	94	84		8 3
	1997	82	92	96	63	69
	1998	83	93	92	-65	65
	1999	7.8	93	92	54	69

SAT Scores

SAT scores are presented in Table 2 for three years before and five years after Jasper County implemented block scheduling. In comparing the scores before and after block scheduling, the first year of block scheduling, 1995, witnessed a drop in both math and verbal scores. However, when the year-to-year fluctuations in average school level SAT scores over the eight-year period represented by the chart are calculated, block scheduling appears to be having no clear effect, positive or negative, on Jasper County's SAT scores.

AP Scores

No AP scores are available for Jasper County High School.

Review of Information from Schools with Four Years of Block Scheduling Schools Began Block Scheduling in the 1995-96 School Year

Four schools began implementing block scheduling in the 1995-96 school year. Osborne High School in Cobb County and Jefferson County High School are both using a 4x4 semester schedule. Dooly County High School and Thomson High School in McDuffie County utilize a block-8 schedule. During the 1995-96 school year, Jefferson County consolidated its two high schools, Louisville High and Wrens High, into Jefferson County High School and began implementing block scheduling.

Georgia High School Graduation Tests

GHSGT information is shown in Table 3 for two years before and four years after the four schools implemented block scheduling. It appears that three of the four schools experienced a drop in some subject areas in the first year of implementing the new schedule, then the scores bounced back to about the pre-block scheduling level or higher. The overall performance of Thomson High School on the GHSGT is better during the block scheduling years than the years before it.

SAT Scores

SAT scores are presented in Table 4 for four years before and four years after the four schools implemented block scheduling. Except for Osborne High, SAT scores decreased in the 1995-96 school year but returned to exceed the pre-block scheduling levels in three schools and nearly so in the fourth for the next three years. In 1999, three of the four schools evidenced a drop in total SAT scores below the year prior to block scheduling. Given the fluctuations in scores for all four schools, such a drop may be attributed to many factors other than block scheduling.

	1999	26	26	11	42.3

In all three schools reported here, the number of students taking AP exams went down, but the percent passing went up from the 1994-95 to the 1995-96 school year. This is not, however, a phenomenon unique to schools using block scheduling. Tables 9 and 10 in the next section of this report indicate that the same pattern applies to the state as a whole. The changes in the numbers of AP exams taken in school years 1995-96 and 1996-97 in some schools most likely reflects changes in legislative funding that paid for students to take the exams. There was a slight drop below preblock scheduling levels in Thomson and Osborne High Schools, while Jefferson High students have shown a considerably higher passing rate since the inception of block scheduling. There is no clear explanation for the one-year drop in Thomson and Osborne High Schools.

Review of Information from Schools with Three Years of Block Scheduling Schools Began Block Scheduling in the 1996-97 School Year

In August 1996, 40 schools started implementing block scheduling. Of the 40 schools, 8 adopted the block-8 schedule, and 32 implemented the 4x4 scheduling system.

Georgia High School Graduation Tests

GHSGT information is shown below fo An examination of the Math and Language Arts scores of the GHSGT reveals the following results on the 40 schools that have three years' experience in block scheduling:

- 14 schools showed a general upward trend (6 in 1998).
- 8 schools showed a general downward trend (9 in 1998).
- 3 schools showed little difference in either content area (3 in 1998).
- 15 schools were "mixed," showing either an increase in one and a decrease in the other, or one stayed about the same and the other was either up or down (21 in 1998). (One school in 1998 did not have sufficient data to be categorized.)

For the purposes of summation in the table below:

- "increase" is defined as at least four scores (of the possible six three each in math and language arts) increased two or more points over the last score before block scheduling was adopted.
- "decrease" is defined as at least four scores dropped two or more points;
- "no change" means at least four scores remained within one point of the previous year's score.
- "mixed" indicates some other combination than the three defined above.

Also taken into consideration are the other scores available prior to the adoption of block scheduling. These constitute the pre-block scheduling trend. It is critical to consider these scores to be sure that the scores in the year just prior to adopting block scheduling might be anomalies (extraordinarily high or low for what has been typical for that school) and would not provide a justifiable comparison.

There is a slight improvement in the number of schools showing a general increase and those showing a general decrease over the 1998 report period. However, without further information about the degree to which each school actually implemented all aspects of block scheduling, and other factors about each school, only general conclusions can be drawn from these scores. It appears that at the very least, block scheduling is doing no harm to these schools' performance on the GHSGT.

SAT Scores

SAT scores are presented in Table 7 for five years before and three years after this group of schools implemented block scheduling. For some schools, not all data are available for all years. The following may be summarized about this set of data:

- 15 schools showed a general increase.*
- 9 schools showed a general decrease.
- 3 schools showed no change; that is, their change over the last several years was either negligible or they appeared to continue the school's historical trend.
- 13 schools showed mixed results.

For the purposes of summation from the table below:

- "increase" is defined as an increase in the total SAT scores during all three years of block scheduling over the last score before block scheduling was adopted.
- "decrease" is defined as a drop in the total SAT score during all three years of block scheduling.
- "no change" means all three total SAT scores remained within one point of the previous year's score.
- "mixed" indicates some other combination than the three defined above.

Also taken into consideration are the other scores available prior to the adoption of block scheduling. These constitute the pre-block scheduling trend. It is critical to consider these scores to be sure that the scores in the year just prior to adopting block scheduling might be anomalies (extraordinarily high or low for what has been typical for that school) and would not provide a justifiable comparison.

(* Numerical comparisons to last year's results are not made for this chart because of the difference in the calculation strategy used this year.)

Once again, it appears that block scheduling is neither improving nor harming the performance of these schools on the SAT as a group.

AP Scores

AP exam school summary results for 1991-92 to 1998-99 school years are presented in Table 8. No AP data are available for Early County High School, Johnson County High School, Long County High School, Lanier County High School, Meriwether County's Manchester High School, and White County High School. White County High School is excluded from this table because of missing post-block scheduling AP data. Also excluded are Haralson County Comprehensive and McIntosh Academy of McIntosh County, both of them have only one year of AP data available. No 1999 AP data are available for Cairo High in Grady County and Lincoln County High. For several other schools, not all data are available for all the years.

As was seen in the previous group of schools with four years of block scheduling experience, AP data for this group of schools also indicate the same pattern of a decrease in the number of students taking the AP exams and an increase in the percent passing in school year 1995-96. Since these changes took place before these schools started implementing block scheduling, block scheduling

does not seem to be linked to these changes. As far as trying to discern a pattern in the data reported on AP for three years' implementation of block scheduling, the number of students involved in many high schools is so small that school-by-school comparisons are unwarranted. For that reason, the schools implementing block scheduling have been aggregated and compared to all non-block scheduling schools in Tables 9 and 10.

Tables 9 and 10 present a comparison between the AP scores for all schools that started block scheduling during the 1996-97 school year and other Georgia high schools. Scores are shown for eight years (1992 – 1999). The two tables are remarkably similar. Both tables show about the same proportional drop in the number of students taking the AP exams and a similar increase in the percent passing the exams between 1995 and 1996. This comparison further illustrates that there is no apparent connection between block scheduling and changes in AP data after the 1995-96 school year.

Review of Information from Schools with Two Years of Block Scheduling Schools Began Block Scheduling in the 1997-98 School Year

In August 1997, 43 schools started implementing block scheduling. Of these, 41 schools adopted the 4x4 schedule and two schools adopted block-8 schedule. One school in this group has only grades 6-9, therefore there is no GHSGT, SAT, and AP data available for it.

GHSGT

High school graduation test information is shown below for four years before and two years after this group of schools implemented block scheduling. Again, two years' data is obviously insufficient to identify a trend, however, the following may be summarized about this set of scores:

- 9 schools showed an increase in both content areas (6 in 1998).
- 8 schools showed a decrease in both content areas (8 in 1998).
- 16 schools were "mixed", showing either an increase in one and a decrease in the other, or one stayed about the same and the other was either up or down (18 in 1998).
- 9 schools showed little difference in either content area (8 in 1998).
 (In 1999, one school did not have sufficient information to be categorized. That number was three in 1998.)

For the purposes of summation in the table below:

- "increase" is defined as at least three scores (of the possible four two each in math and language arts) increased two or more points over the last score before block scheduling was adopted.
- "decrease" is defined as at least three scores dropped two or more points.
- "no change" means at least three scores remained within one point of the previous year's score.
- "mixed" indicates some other combination than the three defined above.

Also taken into consideration are the other scores available prior to the adoption of block scheduling. These constitute the pre-block scheduling trend. It is critical to consider these scores to be sure that the scores in the year just prior to adopting block scheduling are not anomalies (extraordinarily high or low for what has been typical for that school) and would not provide a justifiable comparison.

Without further information about the degree to which each school actually implemented all aspects of block scheduling, and other factors about each school, very little can be concluded from these scores. It appears that, at the very least, block scheduling is doing no harm to these schools' performance on the GHSGT.

SAT Scores

SAT scores are presented in Table 12 for six years before and two years after this group of schools implemented block scheduling. Even though two years of data is not sufficient to come to any reliable conclusions, the following may be summarized about this set of scores:

- 9 schools showed a general upward trend in both content areas. *
- 11 schools showed a general downward trend in both content areas.
- 12 schools were "mixed", showing either an increase in one and a decrease in the other, or one stayed about the same and the other was either up or down.
- 10 schools showed little difference in either content area.

For the purposes of summation in the table below:

- "increase" is defined as an increase in the total SAT scores during both years of block scheduling over the last score before block scheduling was adopted.
- "decrease" is defined as a drop in the total SAT score during both years of block scheduling.
- "no change" means both total SAT scores remained within one point of the previous year's score.
- "mixed" indicates some other combination than the three defined above.

Also taken into consideration are the other scores available prior to the adoption of block scheduling. These constitute the pre-block scheduling trend. It is critical to consider these scores to be sure that the scores in the year just prior to adopting block scheduling might be anomalies (extraordinarily high or low for what has been typical for that school) and would not provide a justifiable comparison.

(* Numerical comparisons to last year's results are not made for this chart because of the difference in the calculation strategy used this year.)

Once again, it appears that block scheduling is doing no harm to these schools' performance on the SAT.

AP Scores

AP exam school summary results for 1991-92 to 1998-99 school years are presented in Table 13. No AP data are available for 10 schools: Bacon County High, Bleckley County High School, Portal Primary and High School of Bulloch County, Crawford County High, Emanuel County Institute, Glascock County High, East Hall High, Irwin County High, Treutlen County High. Four other schools, Southeast Bulloch High, Taylor County High, Telfair County High, and Twiggs County Middle/High are also excluded from this table because of missing pre- or post-block scheduling AP data. There are no 1999 AP data available for Claxton High of Evans County. For several other schools, not all data are available for all the years.

	1999	14	14	8	57.1

As with all of the other block scheduling schools, the pattern of the number of test takers and the percent passing each year since 1995 in this group of schools is consistent with the state pattern (see Tables 9 and 10). This indicates that block scheduling is not affecting the number of students taking AP courses or the passing rate of those students taking one or more AP tests.

Review of Information from Schools with One Year of Block Scheduling Schools Began Block Scheduling in the 1998-99 School Year

In fall 1998, 40 schools started implementing 4x4 block scheduling. Among them, Northgate High of Coweta County had only grades 6-10 before 1998, therefore there is only one year of GHSGT data, two years of AP data, and no SAT data available. This school is then only included in the AP data table, and not in the GHSGT and SAT tables. For the Academic and Career Success Center and Rose Hill Center of Muscogee County, GHGST data are available only for years 1996 to 1999, and no SAT and AP data are available for them. There is also no GHSGT, SAT, and AP data available for the CrossRoads Program of Walton County.

There is only one year of GHSGT data and no SAT and AP data available for the Teenage Parenting Program of Muscogee. So this school is not include in the tables in this section. For Brantley County High, Jeff Davis High of Jeff Davis County, Washington-Wilkes High of Wilkes County, and Wilkinson County Sr. High, there is no post block scheduling AP data available, so these schools are excluded from the AP table. There is no AP data available for Jefferson High of Jefferson City Schools.

Not all schools have all the data for all the years.

GHSGT .

GHSGT information is shown below for five years before and one year after this group of schools implemented block scheduling. Since there is just one year of block scheduling

data, there are no discernable trends. However, the following changes can be recorded for the existing data:

- 5 schools showed an increase in both content areas.
- 6 schools showed a decrease in both content areas.
- 1 school showed little difference in either content area.
- 22 schools were "mixed," showing either an increase in one and a decrease in the other, or one stayed about the same and the other was either up or down.

 (Six schools did not have sufficient information to be categorized.)

For the purposes of summation in the table below:

- "increase" is defined as both math and language arts scores during the one year of block scheduling increased two or more points over the last score before block scheduling was adopted.
- "decrease" is defined as both scores dropped two or more points.
- "no change" means both scores remained within one point of the previous year's score.
- "mixed" indicates some other combination than the three defined above.

Also taken into consideration are the other scores available prior to the adoption of block scheduling. These constitute the pre-block scheduling trend. It is critical to consider these scores to be sure that the scores in the year just prior to adopting block scheduling might be anomalies (extraordinarily high or low for what has been typical for that school) and would not provide a

justifiable comparison.

(* Numerical comparisons to last year's results are not made for this chart because of the difference in the calculation strategy used this year.)

SAT Scores

SAT information is shown below for seven years before and one year after this group of schools implemented block scheduling. Five schools adopting in 1998 had no SAT scores. Again, because there is only one year's data, trends are impossible to discern. However, a simple comparison between the last year before block scheduling and the first year of block scheduling, and taking the seven year non-block scheduling trend into consideration, it can be seen that 19 schools improved and 16 declined under block scheduling.

AP Scores

AP information is shown below for seven years before and one year after this group of schools implemented block scheduling. As with GHSGT and SAT, no trends are discernable.

Table 15
